# AUTO PARTS

1970 EDITION

# CANADA-MAJOR AUTOMOTIVE PRODUCER

Canada has consolidated its position as a major producer and exporter of automotive products in recent years. The industry comprises more than 1,000 firms — most of them listed in this directory — which have the equipment, skills and experience to produce practically every vehicle part and automotive accessory.

The 1965 Canada-United States Agreement on Automotive Products led to the opening of new plants and the expansion of others in Canada, stimulating an investment of more than \$854 million by 1968 compared with \$500 million reached in 1966. The integration of U.S.-Canadian automotive manufacturing facilities which followed implementation of the Agreement, permits longer and more economical production runs. Delivery schedules present no transportation problem as most of the Canadian industry is located within 200 miles of its chief customers across the border.

Mainly as a result of the Agreement the total value of automotive trade between the two countries has increased more than sevenfold — from \$730 million in 1964 to \$5,332.8 million in 1968.

The number of vehicles assembled annually in Canada rose from 900,000 to 1,180,000 between 1966 and 1968.

Statistics showing growth in 1968 compared with 1966 (in brackets):

Number of vehicles exported from Canada — 802,973 (253,000) including 738,377 (199,000) to the United States. Total 1968 imports of vehicles to Canada were 503,775 (205,000).

Value of vehicle exports from Canada, also for 1968 and 1966, was \$1,833.3 million (\$593 million) — \$1,701.1 million (\$493 million) went to the United States and \$132.2 million (\$100 million) to other countries.

Value of parts and accessories exported was \$816.3 million (\$399 million) of which \$749.6 million (\$352 million) went to the United States and \$66.7 million (\$47 million) to other countries.

Canadian companies have demonstrated their ability to meet the exacting production requirements of the expanding North American automotive industry. Many of them manufacture from raw stock to finished component and thus maintain maximum quality control. Canadian firms have developed sufficient flexibility to handle retooling for frequent design changes and to undertake short runs economically. Close inspection during all stages of manufacture assures automotive products of high quality and performance which incorporate the latest safety features stressed in current U.S. and Canadian programs.

The following pages contain information on Canadian sources of supply for products and services which cover a wide spectrum of requirements in the automotive field.

# DIE CASTINGS

Canadian companies have been supplying quality die castings for automotive parts to the North American market for a number of years. Due to modernization and expansion and to the erection of new plants in recent years, these firms are even better equipped today to continue production of quality die castings. They have already established excellent reputations as producers in this field. They are thoroughly familiar with the requirements of the automotive industry and can handle changes in design of automotive component parts by re-tooling whenever necessary.

The versatile die casting plants make long runs manufacturing components from alloys of zinc, magnesium and aluminum. Though product weights range from a fraction of an ounce to 20 pounds or more, quality is consistent.

The major portion of the industry is conveniently adjacent to its customers in the main centers of automobile production in North America.

Canada is a large producer of high-purity aluminum, magnesium and zinc and die casters are assured of continuing supplies in both pure and alloy form to meet their requirements. Primary metal and alloy producers work closely with die casting firms and assist in the solution of production problems.

# FOUNDARY CASTINGS

Canada has a well-equipped modern and progressive foundry industry of which 80 per cent is located within 250 miles of Detroit. The companies supply a variety of automotive and truck parts both for original equipment and for the after-market.

The foundry industry has grown substantially in recent years in response to the challenge of the Canada-United States automotive agreement and a generally buoyant market for castings. New plant expansions which will further improve Canada's ability to supply low-cost quality castings are in various stages of development.

Many foundries are expanding production of iron castings of all classes but the most notable increases are in ductile or nodular irons and in malleable irons. Also available from Canada are high quality castings of steel, aluminum and copper alloys including investment castings.

Canadian foundries are rapidly changing over to electric melting, automatic high pressure molding and shell molding in response to customer demands for castings of even greater quality and closer tolerance.

# FORGINGS

Canada's forgings industry has been improving its capability to serve the automotive market by expanding and diversifying. Some plants have recently installed high production automated presses which, coupled with the latest production controls, place them in an excellent position to supply automotive forgings of consistently good quality.

The industry can also manufacture short-run production items in all the usual SAE steel grades and in non-ferrous metals. The consistent quality of its forgings owes much to the pioneering work carried out in Canada in the continuous casting of steel. Canada has introduced continuous casting on a relatively larger scale than any other country, and forging stock made by this process is readily available at competitive prices. This puts the Canadian steel forging industry in a good position to meet the quality and cost needs of the automotive industry.

# STAMPINGS

Decorative trim, stampings and roll-formed moldings of steel, stainless steel and aluminum have been standard automotive production items in Canada for many years.

Many companies have become specialists in the auto trim field using the most modern machines and techniques to meet exacting specifications for both materials and finish. Plating and anodizing are either built into the production line or carried out nearby.

Several Canadian companies specialize in roll-formed shapes and moldings for the automotive industry. These include windshield garnish moldings, wheel openings, vent window channels, body trim and grille bars — all in high-volume production for most car models.

There are more than 100 companies in Canada experienced in automotive stampings and able to supply orders for specialized short-run items as well as high-volume parts. Most firms are ideally situated for fast deliveries to the United States market.

The Canadian stamping industry has a range of press sizes enabling it to produce competitively automobile parts such as scuff plates, escutcheons, hub caps, wheel covers, interior windshield corner posts, body stampings and frames.

# SINTERED METAL POWDER PARTS

Canada's rapidly growing powder metallurgy industry represents an important and reliable source of automotive parts and components. It has dependable supplies of uniform quality, domestically produced ferrous and non-ferrous metal powders, modern powder compacting and sintering equipment plus craftsmanship to guarantee quality products delivered at competitive prices.

Powder metallurgy parts supplied by Canadian firms range from small bushings, bearings and filters to high density multi-level components used in automotive shock absorbers, fuel pumps and automatic transmissions, where stresses are severe.

All of the Canadian sintered metal parts suppliers are located within a radius of less than 400 miles from Detroit.

# FASTENERS

A continuing program of research and development has placed the Canadian fastener industry more than abreast of new metallurgical processes — in some important areas it leads the way.

It knows, for instance, much about the forces that pull things apart — vibration that unfastens, torque effect that fractures. These hazards are studied and remedies are incorporated in designs that assist in the universal upgrading of product warranties.

The automotive industry uses highly-engineered, automated assembly machines and from year to year demands closer tolerances and ever greater durability. Canadian manufacturers can draw on a wide range of materials — mild steel, high carbon steel, bronze, aluminum and titanium among them — to make products for the most sophisticated applications.

As well as maintaining high production of standard fastener and screw machine products, the versatile Canadian industry will meet individual customer specifications — often on a short-run basis if necessary.

Competitive prices, convenient shipping arrangements and excellent customer delivery service have helped promote the sale of Canadian fasteners.

# NON-METALLICS

Canada has an expanding production of automotive non-metallic products including rubber parts and tires, plastics, molded carpets, adhesives and sealants, operating and maintenance chemicals, brake lining and clutch facing, and batteries.

## Rubber Parts and Tires

Principal components produced in Canada for the automotive industry include pneumatic tires and tubes, V-belts, radiator hoses, heater hose and molded and extruded products such as weather-stripping and engine mounts. The industry has the equipment production facilities and technical expertise to produce a full range of automotive rubber products.

Canadian factory shipments of rubber products — excluding tires — rose from \$134 million in 1960 to approximately \$260 million in 1967. Tire shipments amounted to \$282 million in 1967 and rose a further 12 per cent in 1968.

Located primarily in southern Ontario the Canadian rubber industry is within easy reach of the U.S. automotive market.

## Plastics

Canadian injection molders participating in the development and molding of plastic parts for Canada's automotive industry have the experience and ability to meet the exacting production requirements of this thriving industry.

The design and development of new plastic materials have enabled the Canadian plastics industry to mold intricate and serviceable parts at low costs that satisfy customers in this demanding market.

This special skill has been responsible for the growth of the fabricated plastics industry from \$109 million in 1961 to \$273 million in 1967. With a projected growth of 18 per cent per year, sales for 1970 are estimated to reach \$450 million.

## Molded Carpets

Before 1966, the production of molded carpets in Canada was directly proportional to the increase of domestic passenger car registration and manufacturing facilities were only adequate for domestic requirements. Modern equipment added to Canadian plants has enabled manufacturers to export in excess of \$1.5 million of molded carpets in 1968. Factories producing molded carpets are located in Quebec and Ontario and are geographically and economically in an excellent position to serve the expanding needs of the North America automotive industry.

## Adhesives and Sealants

Factory shipments of adhesives and sealants in Canada have increased approximately 22 per cent from \$47 million in 1966 to \$57 million in 1968. The latter figure includes about \$3.5 million in sealants, mastics, plastisols and sound deadening compounds specifically for the automotive industry. A wide range of general and special purpose adhesives is being manufactured. These are specially designed for bonding many combinations of materials such as metal to metal, metal to rubber, metal to plastics, insulation and others. Individual products can be obtained which are designed for extremes of temperature as well as normal conditions. Several new manufacturers have entered the field adding substantially to total production.

### **Operating and Maintenance Chemicals**

Canadian production of operating and maintenance chemicals for automobiles totalled more than \$10 million in 1968, an increase of 15 per cent over 1966. This increase resulted from greater use of such specialty products as engine conditioners, starting fluids, windshield de-icers, fire extinguishers, body fillers, specialty lubricants, touch-up paints, and certain aerosol products. Antifreeze and brake fluids, representing respectively 20 per cent and 15 per cent in dollar value of this market, have been growing slowly as automobile production has increased.

### **Brake Linings and Clutch Facings**

There are five factories in Ontario and Quebec manufacturing friction material products for Canada's 7,500,000 motor vehicles. They supply brake linings and clutch facings as original equipment and for replacement. These factories are well equipped to produce for all makes of vehicles coming off the United States and Canadian assembly lines. This industry has the experience, the ability and the open production capacity to provide prompt delivery on friction materials that meet the rigid specifications and requirements of the U.S. and Canadian automotive market.

### **Batteries**

Canada's battery industry is composed of two sections, the replacement and the original equipment markets. The combined annual production for both of these markets is 3,656,000 units. The Canadian automobile battery industry has manufacturing facilities across the country, from the province of British Columbia on the west coast to Nova Scotia on the east coast.

Tel: (202) 332-1011

## Summary of Canada - United States agreement on automotive products

Under this Agreement, the United States agreed, and subsequently provided for in the Act of October 21, 1965, to accord duty-free treatment to imports of Products of Canada\* described as follows:

(1) Motor vehicles for the transport of persons or articles as provided for in items 692.05 and 692.10 of the Tariff Schedules of the United States and chassis therefor, but not including electric trolley buses, three-wheeled vehicles, or trailers accompanying truck tractors, or chassis therefor.

(2) Fabricated components, not including trailers, tires, or tubes for tires, \*for use as original equipment in the manufacture of motor vehicles of the kinds described in paragraph (1) above.

(3) Articles of the kinds described in paragraphs (1) and (2) above include such articles whether finished or unfinished.

\*These two qualifications are important. They are carefully defined and are covered by the phrase "if Canadian article and original motor-vehicle equipment" in all U.S. Tariff items which provide for duty-free entry of the parts described in subparagraph (2) above.

### **Definition of "Original Motor-Vehicle Equipment"**

The Act of October 21, 1965, provides the following definition:

"The term 'original motor-vehicle equipment,' as used in the schedules with reference to a Canadian article, means such a Canadian article which has been obtained from a supplier in Canada under or pursuant to a written order, contract, or letter of intent of a bona fide motor-vehicle manufacturer in the United States, and which is a fabricated component intended for use as original equipment in the manufacture in the United States of a motor vehicle, but the term does not include trailers or articles to be used in their manufacture.

"The term 'motor vehicle,' means a motor vehicle of a kind described in tariff items 692.05 and 692.10 (excluding an electric trolley bus and a three-wheeled vehicle) or an automobile truck tractor.

"The term 'bona fide motor-vehicle manufacturer,' as used in this head-note, means a person who, upon application to the Secretary of Commerce, is determined by the Secretary to have produced no fewer than 15 complete motor vehicles in the United States during the previous 12 months, and to have installed capacity in the United States to produce 10 or more complete motor vehicles per 40-hour week. The Secretary of Commerce shall maintain, and publish from time to time in the Federal Register, a list of the names and addresses of bona fide motor-vehicle manufacturers."
